

Parallelization of Neural Network Training

Final presentation | High-Performance Big Data and Artificial Intelligence Systems (高效能巨量資料與人工智慧系)

Lukas Voss | 5 June 2023

Agenda

Parallelization of Neural Network Training

1. **Motivation**
   - Growing impact of Artificial Intelligence (AI) makes efficient resource use crucial for advancements
   - GPU provides attractive parallelization capabilities for matrix-operations like in Neural Networks
2. **Implementation + Results**
   - CPU vs. GPU in like-for-like analysis for image classification with MNIST data set
   - Varying hyperparameters to investigate impact on performance and accuracy KPIs
3. **Summary and Outlook**
   - Key findings and highlights
   - Discussion and Q&A

Training of Neural Networks

CPUs are not well-suited to handle workload and lead to prohibitively long training times

The current performance gap [1]

Deep Learning's popularity >10x over the last decade [2]

- Research on deep learning models has accelerated due to increased data availability, better algorithms and hardware
- Especially in focus for AI-related tasks

- Text, object and speed recognition for NLP tasks
- Robotics, including autonomous vehicles and robotic control systems

- Widely available CPUs cannot efficiently process the amount of used data for training large models
- Time and resource constraints become important factors

 © Lukas Voss

Deep Dive: Motivation

AI has the potential to lead to major efficiency improvements across industries

“

It's very clear that AI is going to impact every industry. I think that every nation needs to make sure that AI is a part of their national strategy. Every country will be impacted.

- Jensen Huang[1]

Healthcare

- Enhance diagnostics, e.g., medical imaging analysis
- Predict disease outcomes
- Enable personalized medicine, and facilitate drug discovery

Education

- Intelligent educational content generation
- Support personalized learning
- Adaptive tutoring systems, automated grading

1) Founder and CEO of NVIDIA; Quote taken from an interview in 2018

Agenda

Parallelization of Neural Network Training

1 Motivation

- Growing impact of Artificial Intelligence (AI) makes efficient ressource use crucial for advancements
- GPU provide attractive parallelization capabilites for matrix-operations like in Neural Networks

2 Implementation + Results

- CPU vs. GPU in like-for-like analysis for image classification with MNIST data set
- Varying hyperparameters to investigate impact on performance and accuracy KPIs

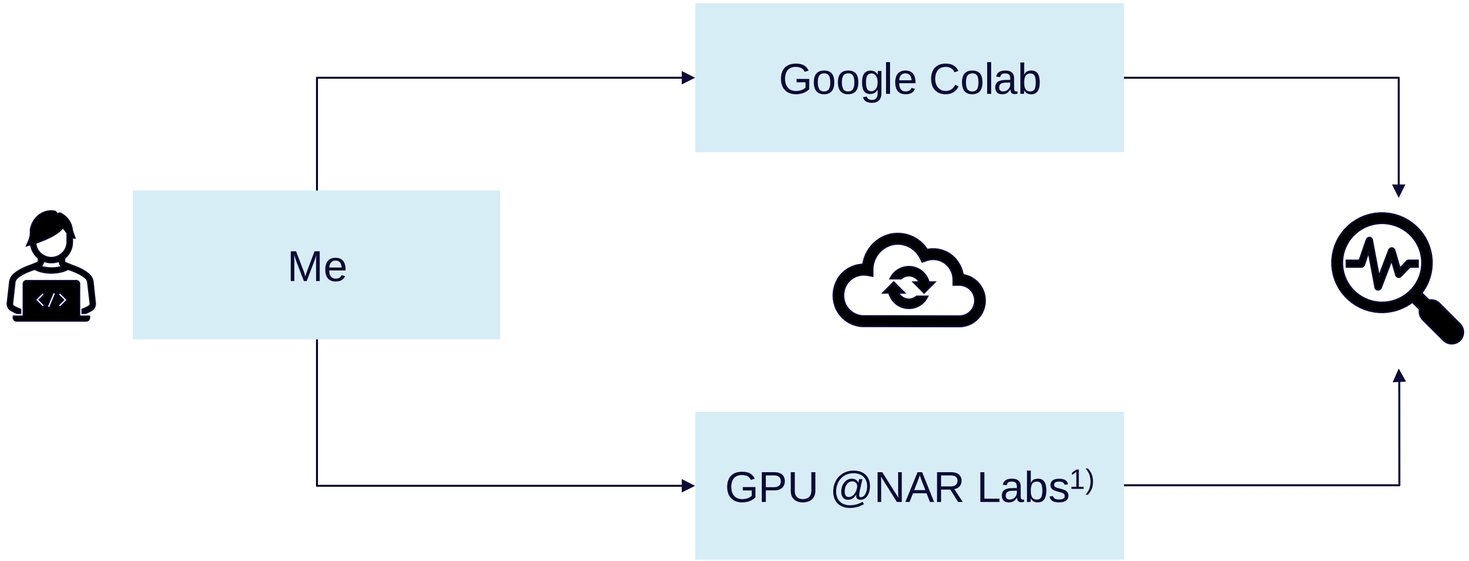

3 Summary and Outlook

- Key findings and highlights
- Discussion and Q&A

 © Lukas Voss

System Architecture

Access to GPU was granted by Taiwan High-Performance Computing Cluster NAR Labs

System Design

- An account at NAR Labs enabled us to use their NVIDIA RTX 3070 GPU as a cloud-based service
- Convenient access on-demand for improved flexibility

1) National Center for High-Performance Computing

 © Lukas Voss

Neural Network Training

A comprehensive approach to test performance potential lifted by GPU

Dataset

- Image recognition task with 28x28 pixel on a grayscale
- The MNIST dataset has handwritten digits with 60,000 training and 10,000 test images

Method

- Convolutional Neural Network with ReLu activation and pooling layer
- Softmax output layer

Evaluation and benchmarking again CPU

- Conduction like-for-like comparisons[1)] between Google Colab CPU and GPU
- GPU will be tested with and without explicit data loading parallelization

Note MLP: multi-layer perceptron 1) Evaluation on the same task

 © Lukas Voss

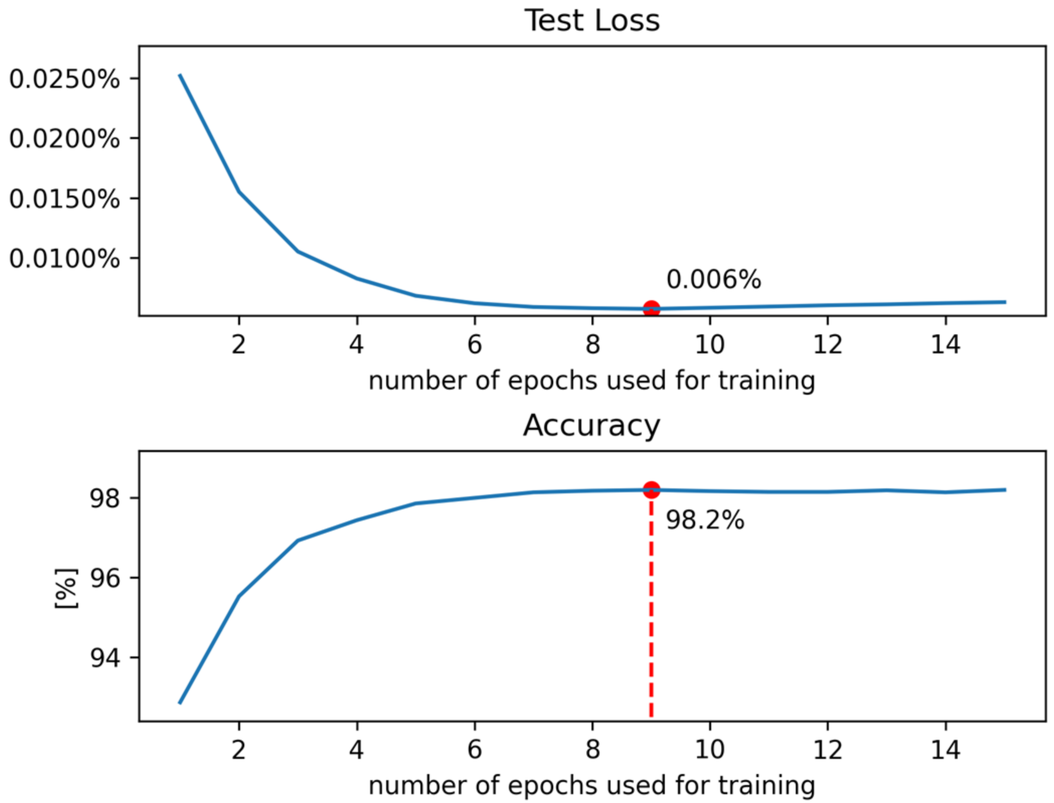

Google Colab CPU: Training epochs

After a sweet spot of #epochs has been surpassed, more epochs do more harm than good

Parameters

Execution Time	48 sec
Optimizer	SGD[1]
Learning Rate	0.1

Performance

1) Stochastic Gradient Descent

 © Lukas Voss

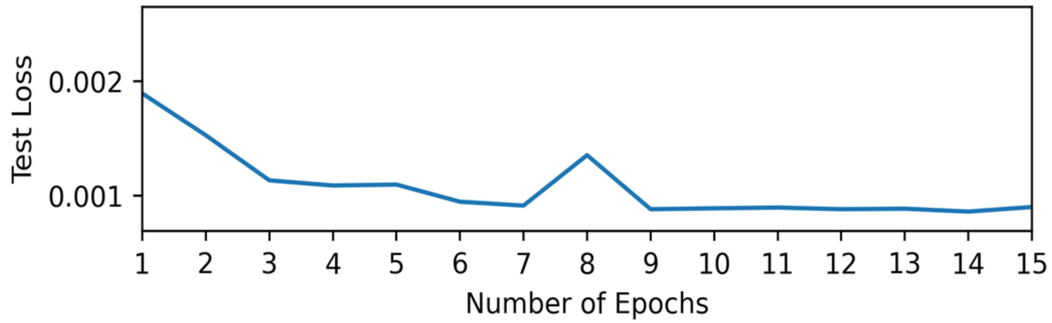

NVIDIA RTX 3070: Training epochs

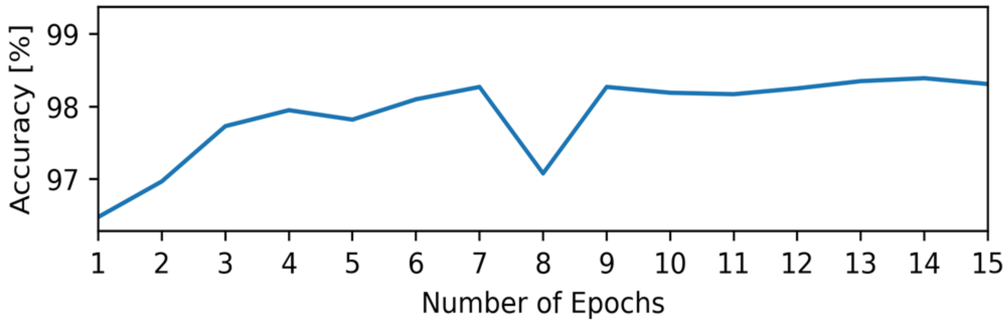

Data loading operations parallelized with four worker processes leads to performance gain

Parameters

Execution Time	16 sec
Optimizer	SGD[1]
Learning Rate	0.1

Performance

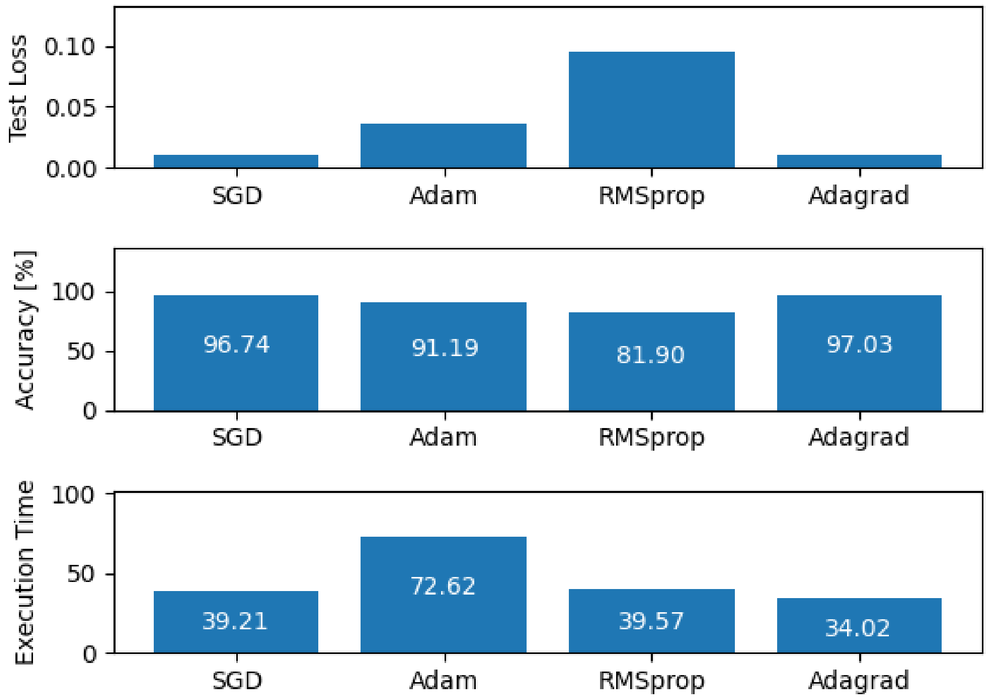

1) Stochastic Gradient Descent

 © Lukas Voss

Deep Dive: Variation of Optimizers

Leveraging the capabilities of the GPU, we achieve a significant speed up in training time

Google Colab CPU: Intel(R) Xeon(R) CPU @ 2.20GHz

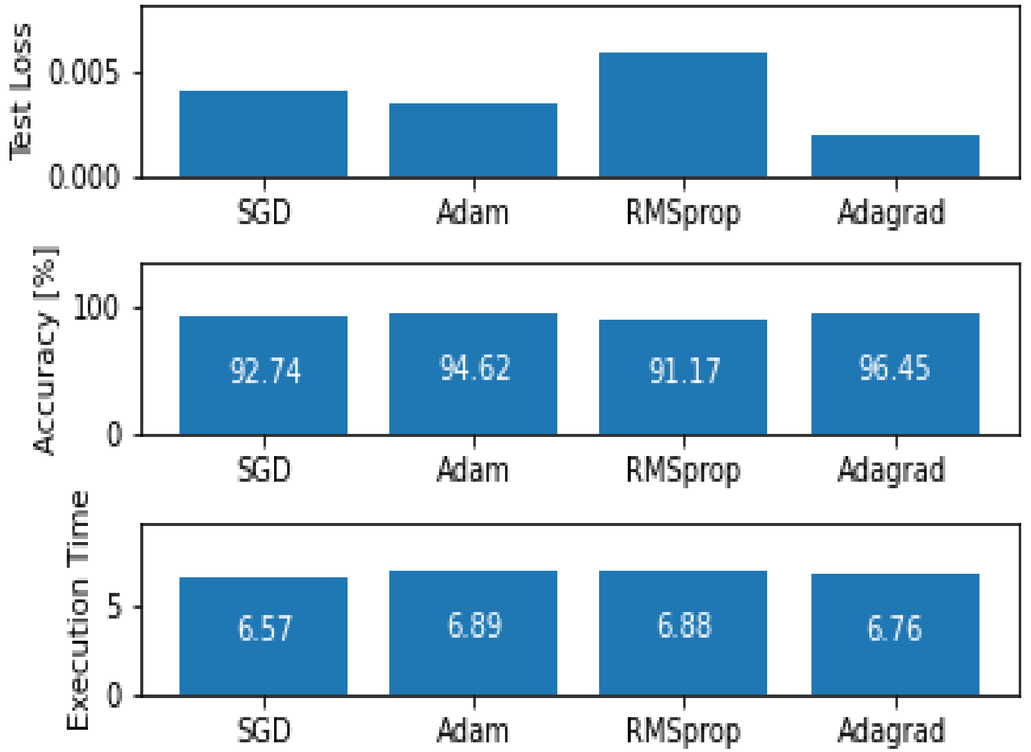

10x

Agenda

Parallelization of Neural Network Training

1 **Motivation**

- Growing impact of Artificial Intelligence (AI) makes efficient ressource use crucial for advancements
- GPU provide attractive parallelization capabilites for matrix-operations like in Neural Networks

2 **Implementation + Results**

- CPU vs. GPU in like-for-like analysis for image classification with MNIST data set
- Varying hyperparameters to investigate impact on performance and accuracy KPIs

3 **Summary and Outlook**

- Key findings and highlights
- Discussion and Q&A

 © Lukas Voss

Executive Summary

Customizing the GPU‘s inbuilt capacity to parallelize further improves performance

Performance

- Significant improvements in execution time up to 8x faster compared to CPU
- Model has different sensitivity to different parameters

Distributed Architecture

- Efficiently load and preprocess data in mini-batches during the training and testing phases

Outlook

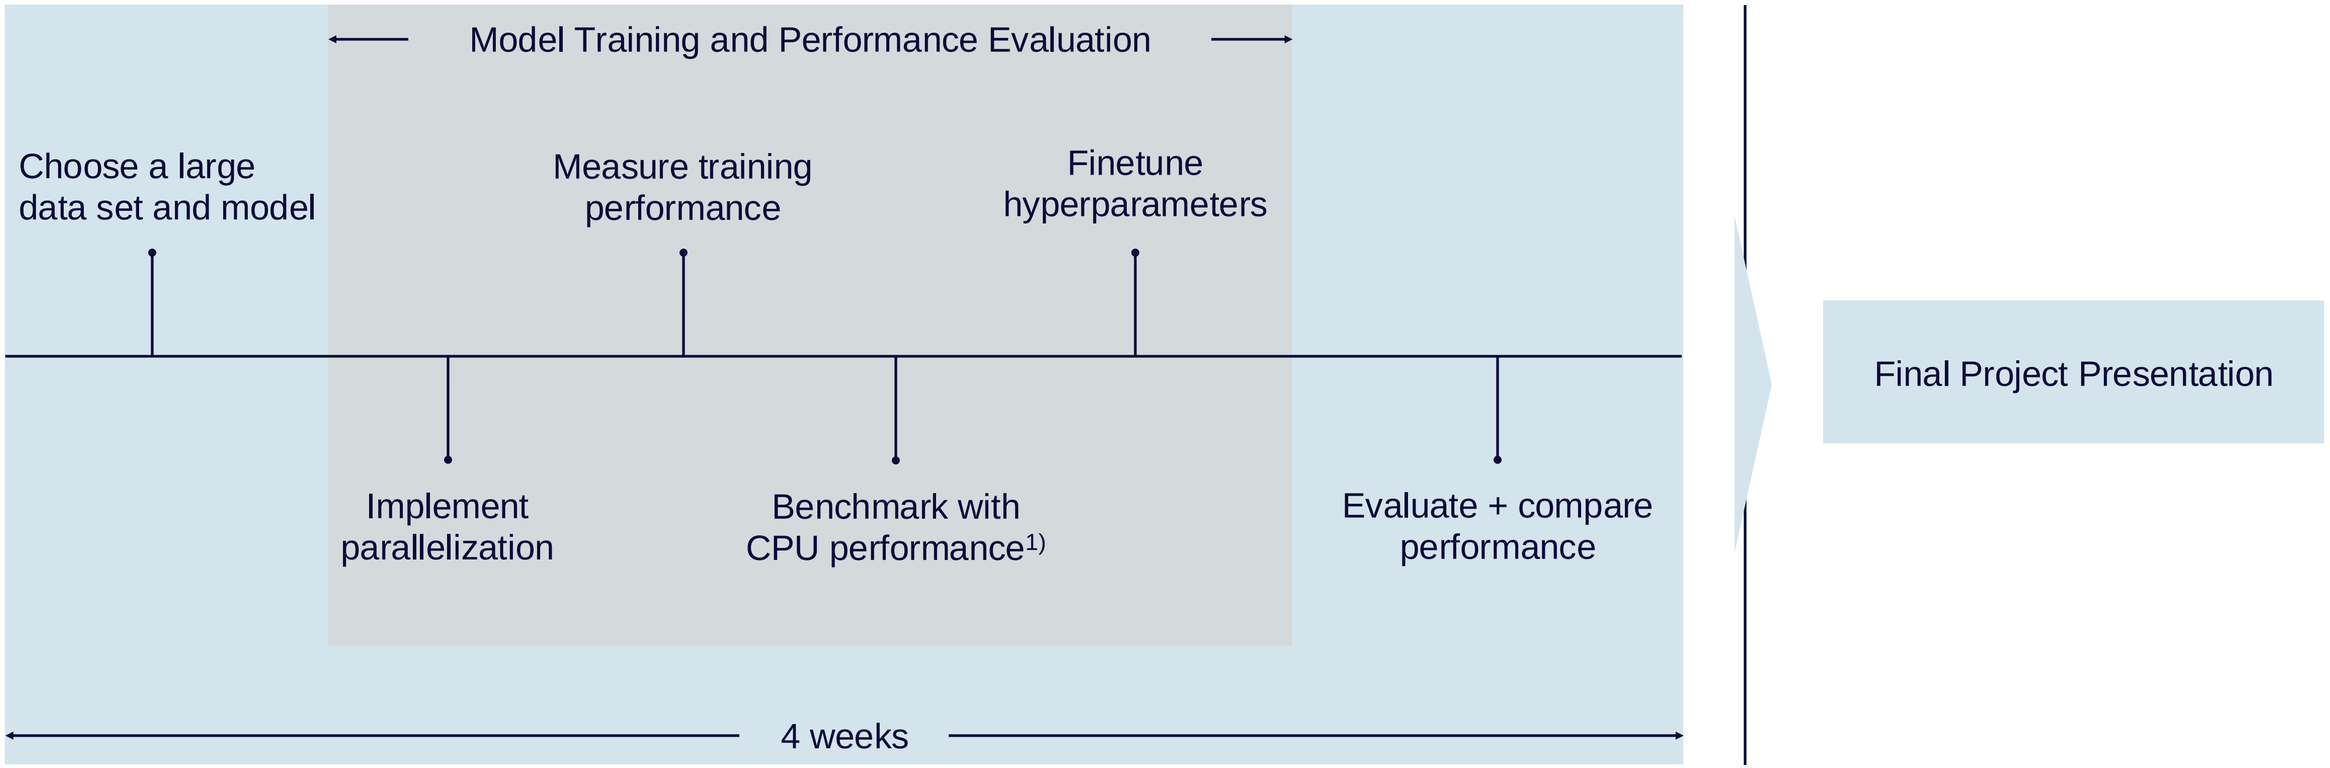

- Fine-tuning the implementation on the architecture
- Explore model parallelism
- Consult with industry experts and literature

 © Lukas Voss

Appendix: Timeline of Implementation

Top-level view of the proposed research idea: Parallelization of Deep Learning Training

1) Google Colab CPU: Intel(R) Xeon(R) CPU @ 2.20GHz
